A N

ALMANACK,

FOR THE YEAR OF OUR LORD AND SAVIOR,

1778.

Being the second after Leap Year, and second of American INDEPENDENCY.

The Solar System.

I consider the Heavens, the work of thy fingers, the Moon and the Stars which thou hast ordained.

CALCULATED FOR THE MERIDIAN OF BOSTON, LAT. 42 25.

By DANIEL GEORGE.

NEWBURY-PORT: Printed and Sold by John Mycall: Sold also by the Shopkeepers in Town and Country. Price 8 shillings per dozen, & 1 do. single.

1 The Sun ☉ an immense globe of fire, occupies the center; and turns round his axis in 25 days 6 hours; this motion is discoverable by the Macula or dark spots on his Disk. His diameter as formerly computed by Astronomers is 763,000 miles. And, by the various attractions of the circumvolving planets, he is agitated by a small motion round the centre of gravity of the system. all the planets, as seen from him move the same way.

2. Next to the Sun is the planet Mercury which goes round him (as in the circle marked ☿) in 87 days 23 hours; which is the length of the year. But the length of his days and nights is as yet unknown. His distance from the Sun, as formerly computed is about 32 millions of miles, and his diameter 2600 His light and heat from the Sun are nearly seven times as great as ours: and the Sun appears to him nearly seven times as large as to us.

3. Venus ♀ the next planet in order, is computed to be 59 millions of miles from the Sun; and goes round him in 223 days 17 hours of our time nearly; ---- every day and night together with her is as long as 24½ days and nights with us.

4. The Earth is the next planet above Venus in the system, it is 82 millions of miles from the Sun, and goes round him (as in the circle ⊕) in 365 days, 5 hours, 49 minutes, from any Equinox or Solstice to the same again; but from any fixed Star to the same again, as seen from the Sun, in 365 days 6 hours and 9 minutes, her diameter is 7957⅔ miles; and by turning round its axis every 24 hours from west to east, it causes an apparent diurnal motion of all the Heavenly bodies from east to west.

The Earth is round like a globe; as appears, 1. by it's shadow in eclipses of the Moon; which shadow is always bounded by a circular line: 2. By our seeing the masts of a ship whilst the hull is hid by the convexity of the water. 3. By its having been sailed round by many navigators. The hills take off no more from the roundness of the Earth in comparison, than grains of dust do from the roundness of a common globe. The seas and unknown parts of the Earth (by a measurement of the best maps) contain 160 million 522 thousand and 26 square miles; the inhabited parts 38 million 390 thousand 569: Europe 4 million 456 thousand and 65; Asia 10 million 768 thousand 823; Africa 9 million 654 thousand 807; America 14 million 110 thousand 874. In all, 199 million 512 thousand 595; which is the number of square miles on the whole surface of our globe.

5. The Moon is not a planet, but only a satellite or attendant of the Earth; going round the Earth from change to change in 29 days 12 hours and 44 minutes; and round the Sun with it every year.—The Moon's diameter is 2180 miles and her distance from the Earth's centre 240 thousand. She goes round her orbit in 27 days 7 hours 43 minutes; and turns round her axis exactly in the time that she goes round the Earth, which is the reason of her keeping always the same face towards us, and that her day and night taken together is as long as our lunar month.

6. Mars is next in order, being the first above the Earth's Orbit. His distance from the Sun is computed to be 125 millions of miles; and as in the circle ♂ he goes round the Sun in 686 of our days and 23 hours; which is the length of his year and contains 667 of his days; every day and night together being forty minutes longer than with us. His diameter is 4444 miles, and his quantity of light and heat is equal but to one half of ours; and the Sun appears but half as big to him as to us.

7. The next beyond Mars is Jupiter, which is the biggest of all the planets, being about 426 millions of miles from the Sun, and going round the Sun as in the circle ♃ in 4332 days and 12 hours. He is above a thousand times as big as the Earth, and he turns round his axis in 9 hours 56 minutes.

The Sun appears but the 28th part so big to Jupiter as to us; and his light and heat are in the same small proportion, but compensated by the quick returns thereof, and by four Moons which revolve about him: So that there is scarce any part of this high planet but what is, during the whole night enlightened by one or more of these Moons, except his poles, whence only the farthest Moons can be seen, and where their light is not wanted, because the Sun constantly circulates in or near the Horizon, and is very probably kept in view of both poles by the refraction of Jupiters atmosphere, which, if it be like ours, has certainly refractive power enough for that purpose.

8. Saturn, the remotest of all the planets, is about 780 millions of miles from the Sun; and moves round him as in the circle marked ♄ in 10759 days and 7 hours. It's diameter is 67 thousand miles; and therefore it is near 600 times as big as the Earth. But the length of his days and nights are unknown to us. To Saturn the Sun appears only the 90th part so big as to us; and the light and heat he receives from the Sun are but the 90th part so great as ours. But to compensate for the small quantity of Sun light, he has five Moons revolving about his body, as our Moon does about the Earth.

9. The Comets are ſolid opaque bodies, with long tranſparent trains or tails, iſſuing from that ſide which is turned away from the Sun. They move about the Sun, in very excentric ellipſes; and are of a much greater denſity than the Earth; for ſome of them are heated in every period to ſuch a degree, as would vitrify or diſſipate any ſubſtance known to us. Sir Iſaac Newton computed the heat of the Comet which appeared in the year 1680 (part of the path of which is repreſented in the Solar Syſtem by part of an ellipſis) when neareſt the Sun, to be two thouſand times hotter than red hot iron, and that being thus heated, it muſt retain it's heat until it comes round again, altho' it's period ſhould be more than twenty thouſand years; and it is computed to be only 575.

This Comet, at it's greateſt diſtance, is about eleven thouſand two hundred millions of miles from the Sun; and at it's leaſt diſtance from the Sun's centre, which is 49,000 miles, is within leſs than a third part of the Sun's ſemidiameter from his ſurface. In that part of it's orbit which is neareſt the Sun, it flies with the amazing ſwiftneſs of 880,000 miles in an hour; and the Sun, as ſeen from it appears an hundred degrees in breadth; conſequently, 40 thouſand times as large as he appears to us. The aſtoniſhing length that this Comet runs out into empty ſpace, ſuggeſts to our minds an idea of the vaſt diſtance between the Sun and the neareſt fixed ſtars; of whoſe attraction all the Comets muſt keep clear, to return periodically, and go round the Sun; and it ſhews us alſo, that the neareſt ſtars, which are probably thoſe that ſeem the largeſt, are as big as our Sun and of the ſame nature with him; otherwiſe, they could not appear ſo large and bright to us as they do at ſuch an immenſe diſtance. To aſſiſt the imagination in forming an idea of the vaſt diſtances of the ſun, planets and ſtars, let us ſuppoſe, that a body projected from the ſun ſhould continue to fly with the ſwiftneſs of a cannon ball, i. e. 480 miles every our; this body would reach the orbit of Mercury, in 7 years 221 days; of Venus, in 14 years 8 days; of the Earth in 19 years 91 days; of Mars, in 29 years 85 days; of Jupiter, in 100 years 280 days; of Saturn, in 184 years 240 days; to the Comet of 1680, at it's greateſt diſtance from the Sun, in 2660 years; and to the neareſt fixed Stars in about 7 million 600 thouſand years.

What an auguſt! what an amazing conception, if human imagination can conceive it; does this give of the works of the Creator! Thouſands of thouſands of Suns, multiplied without end, and ranged all around us, at immenſe diſtances from each other, attended by ten thouſand times ten thouſand Worlds, all

in rapid motion, yet calm, regular, and harmonious, invariably keeping the paths prescribed them; and these worlds peopled with myriads of intelligent Beings, formed for endless progression in perfection and felicity.—

If so much Power, Wisdom, Goodness and Magnificence is displayed in the material creation, which is the least considerable part of the Universe, how great, how wise, how good must HE be who made and governs the Whole?

When we muse on these things we may loose our selves in holy wonder, and cry out with the Psalmist, *Lord, what is man that thou art mindful of him, and the son of man that thou shouldst visit him?*

* See Title Page.

AN ACCOUNT OF THE TIDES ACCORDING TO THE COURSE OF THE MOON.

January; middling high tides from the Perigee to the Full.—February; small tides this Month—March; very low tides—April; midling high tides from the Change to the Perigee—May; very high spring tides at the Change only—June; very high tides from the Perigee to the Change—July; very high tides from the Perigee to the Change—August; no very high tides this Month—September; very low tides this Month—October; no very high tides—November; midling tides from the Full to the Perigee—December; very high spring tides at the Full only.——

An account of the *Meetings* in NEW ENGLAND of that friendly society called QUAKERS.

AT *Sandwich* the 6th day, before the last first day in the 3d month.
At *Greenwich* the last first day in the fifth month.
At *Rhode Island*, the second sixth day of the sixth month.
At *Nantucket*, the fourth sixth day of the sixth month.
At *Kingston*, the second first day of the eighth month.
At *Providence*, the fourth first day of the eighth month.
At *Salem*, the fourth first day of the ninth month.
At *Scituate*, the first sixth day of the tenth month.
At *Dartmouth*, the fourth sixth day of the tenth month.
At *Swanzey* the second seventh day of the eleventh month.

Vulgar Notes for the Year 1773.

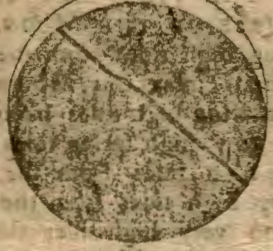
Eclipses for the Year 1778.

The two grand Luminaries of Heaven will be eclipsed three times this Year, the Sun twice, and the Moon once, in the following order, viz.

1. The first will be of the Sun June 24th. day, visible, and according to calculation as follows.

	H.	M.	S.	
Beginning at	9.	18.	15	Equal time in the morning.
Greatest obscuration, or, middle at	10.	35.	25	
End at	11.	56.	43	
Duration	2.	38.	30	

Digits eclipsed 11¼ see the type underneath.



A Type of the above-mentioned Solar Eclipse, which will happen on the 24th day of June, 1778.

2. The second of the Moon December 4th day; visible, as follows.

	H.	M.	S.	
Beginning at	11.	40.	15	Even of the 3d. Day.
Middle at	0.	51.	30	Morn. of the 4th. Day.
End at	2.	2.	45	Equal Time.
Duration	2.	22.	30	

Near six Digits eclipsed.

3. The third, and last, will be a Solar Eclipse December 18th day at 5 H. 22 M. Afternoon invisible to us.

Names and characters of the Signs, Planets, and Aspects.

SIGNS.

Aries ♈ the Ram. Taurus ♉ the Bull. Gemini ♊ the Twins. Cancer ♋ the Crab. Leo ♌ the Lion. Virgo ♍ the Virgin. Libra ♎ the Ballance. Scorpio ♏ the Scorpion. Sagittarius ♐ the Archer. Capricornus ♑ the Goat. Aquarius ♒ the Water bearer. Pisces ♓ the Fishes.

PLANETS

PLANETS.

Saturn ♄. Jupiter ♃. Mars ♂. Sol ☉. Venus ♀. Mercury ☿. Luna ☽.

ASPECTS.

Conjunction ☌. Semisextile ⚺. Sextile ⚹. Quartile □. Trine △. Quincunx ⚻. Opposition ☍.

NODES, Dragon's Head ☊ and Tail ☋.

An account of some extraordinary Rarities of Nature.

Towards the Southern part of Gothland is a remarkable slimy lake which singes such things as are put into it.—In Russia is a strange sort of Melon, found in or near to Astrakan, Cazan, and Samara: Some of the natives term it Boranetz, or the little Lamb; others Zoophyton, which signifies the animal plant. The first title would seem most proper, because in figure it resembles a Lamb, and such is its vegetable heat, that it consumes and eats up all the grass and herbs within it's reach. As the fruit ripens, the stalk decays, and is covered with a substance exactly the same with wool that is short and curling. A part of the skin of this remarkable plant is to be seen in the King of Denmark's repository of natural rarities at Copenhagen; the inside of which skin being dressed as tanners usually do the fleshy side of Lamb-skins without taking off the wool, no man can distinguish between the skin of the Boranetz and that of an ordinary Lamb; whereupon many of the Muscovites use the skin of this rare vegetable in stead of furs for lining their vests.—There is a famous fountain near Grenoble in France, which appeareth as if covered with flames, and boileth up in great bubbles, and yet is never hot.—There are observable mountains high to Rodez in Guienne, called the mountains of Canfac, which burn whenever it rains.—Near St. Omers is a large Lake, in which are divers floating islands, most of which are inhabited.—There is a lake in Suabia, the nature of whose waters is such, that they actually singe fishing nets when sunk to the bottom.—In the deserts of Padolia is a lake, whose waters condense into solid salt, purely by the heat of the Sun.—Near Culm in Polish Prussia, is a fountain, which constantly sends up streams of sulphur, though its waters are never hot.—Near Guadalajara in New Castile, is a lake which never fails to make a rumbling noise before a storm.—There are waters in Hungary that corrode iron so as to consume a horse shoe in 24 hours.—Near Wigan in Lancashire in England is a well, which being emptied there breaks out a sulphureous vapour, making the water bubble up as if it boiled, and a candle being put thereto it instantly takes fire and burns like brandy: During a calm, the flame continues a whole day, and by its heat they can boil eggs or meat, and yet the water itself is

cold.—At a small Village, called Newton in Glamorganshire in Wales, is a remarkable spring nigh the Sea, which ebbs and flows contrary to the Sea.—In the island of Madagascar is a river, whose gravel is so very hot, that there's no treading upon it, and yet the water of that river is extremely cold.—In several parts of the Mogul's Empire, particularly Cambay or Guzarat, are divers noted Volcanos, or burning mountains which usually smoke, and sometimes break out in terrible eruptions of fire and sulphureous matter.—Not far from Damoan in America, is a prodigious Pike of the same name, being the highest part of mount Taurus, from whose top, covered over with sulphur, which sparkles in the night like fire, one may clearly see the Caspian sea, tho' one hundred and eighty miles distant.—In the Island of Banda is a terrible Volcano which once made a dreadful eruption, not only of fire and sulphur, but of such a prodigious number of stones, that they covered a great part of the Island; and so many fell into the sea, that where it was forty fathom water near the shore, is now a dry beach.—In Ternat Island is another Volcano, reckoned more terrible than the former.—About the middle of Sumatra is another burning mountain, which vomits fire and ashes like mount Ætna or Vesuvius.—

The following Method of rearing TURKEYS is successfully practised among the *Swedes.*

THEY plunge the chick into a vessel of water, the very hour, if possible, at least the very day it is hatched, forcing it to swallow one whole peppercorn, after which, they return it to the mother. From that time it becomes hardy, and fears the cold no more than a hen's chick. But it must be remembered, that this delicate species of fowl is subject to a particular disorder when young, which frequently carries it off in a few days. when any begin to droop, examine carefully, the feathers on the rump, and you will find there two or three, the quill part of which, will be filled with blood; draw these and the chick will recover, and afterwards will require no other care than is bestowed upon common poultry.

Epigram on an Old Woman's Alarm to a Society of Gentlemen, who were spending a joyous Evening when the Inundation happened at Chelsea.

"*SIRS, the Serpentine river is coming up stairs!*
"*Pray get out of the house, for it surely will sink it!*"
"*Get along, you old W—h, and to drown all our cares,*
"*Threw in Brandy and Sugar, and then we will drink it.*"

None lives in this tumultuous ſtate of things,
Where ev'ry morning ſome new trouble brings,
But bold inquietude will break his reſt,
And gloomy thoughts diſturb his anxious breaſt.
Angelic forms, and happy ſpirits are
Above the malice of perplexing care!

Had yet ſome anxious care, to make him know,
No grandeur was above the reach of woe.
To be from all things that diſquiet, free,
Is not conſiſtent with humanity.
Youth, wit, and beauty, are ſuch charming things,
O'er which if affl'ence ſpreads her gaudy wings,

We think the perſon, who enjoys ſo much,
No care can move, and no affliction touch;
Yet, could we but ſome ſecret method find
To view the dark receſſes of the mind,
We there might ſee the hidden ſeeds of ſtrife,
And woes in embryo rip'ning into life:

How some fierce lust, or boist'rous passion, fills
The lab'ring spirit with prolific ills;
Pride, envy, or revenge, distract the Soul,
And all right reason's Godlike pow'rs controul
But if she must not be allow'd to sway,
Tho' all without appears serene and gay,

A cank'rous venom on the vitals preys,
And poiſons all the comforts of his days.
External pomp and viſible ſucceſs
Sometimes contributes to our happineſs:
But that which makes it genuine, refin'd
Is a good conſcience and a Soul reſign'd.

Then, to whatever end affliction's sent,
To try our virtues, or for punishment,
We bear it calmly, tho' a pond'rous woe,
And still adore the hand that gives the blow:
For, in misfortunes this advantage lies,
They make us humble, and they make us wise:

the 22 of this month Mr Wells horse went into pasture

Thus lull'd into a sleep, we dosing lie,
And find our ruin in security;
Unless some sorrow comes to our relief,
And breaks th' inchantment, by a timely grief.
But as we are allow'd, to chear our sight,
In blackest days some glimm'rings of the light;

So in the moſt dejected hours, we may
The ſecret pleaſure have to weep and pray:
And thoſe requeſts the ſpeedieſt paſſage find
To Heav'n, which flow from an afflicted mind:
And while to him we open our diſtreſs,
Our pains grow lighter, and our ſorrows leſs.

The finest musick of the grove we owe
To mourning Philomel's harmonious woe;
And while her grief's in charming notes expres'd,
A thousand bramble pricks her breast undreast
In warbling melody she spends the night,
And moves at once compassion and delight.

The Farmer's Privilege vindicated by the Genius of America: Or a Receipt to make WINE *as good as most that is imported, and much Cheaper.*

TO a Gallon of Water, add a Gallon of Currants, mash them, and [illegible] Liquor from them, and to every Gallon of Liquor, put [illegible] and three Quarters of good brown Sugar; put it in a [illegible] Cask, and let it stand three or four days, that it may work, with the bung out; then bung it up, and it will be fit to drink by Christmas.

Probatum est.

THE highest price is given, at the Printing-Office in Newbury Port, for all sorts of Linen and Cotton RAGS. ——*The smallest pieces are (in proportion to their bigness) as serviceable as large.*——*Good* WRITING-PAPER *will be given in Exchange, at a very low price, if wanted.*
